```python
def integratedGradients(model,X,Xbase,Steps=50):
    '''
    model: Keras (Tensorflow backend) model
    X: Input vector ~ True image
    Xbase: Baseline Vector
    Steps: How close do you want to approximate integral
    '''

    # Initialize
    X_new = X-Xbase # Construct (X-X') term
    funcinp = []

    # Construct Function Inputs
    for i in range(Steps):
        # Sum over input to F(x): x'+(k/m)*(X'-X)
        temp = X_new*(float(i)/Steps)+Xbase
        funcinp.append(temp)

# Calculate Gradients with TensorFlow backend
xx = model.inputs[0]
f = model(xx)
df_dx = tf.gradients(f,xx)
# Feed in data to input tensor F(temp)
a = sess.run(df_dx, feed_dict={xx:funcinp})

# Riemann Sum
summate = [sum(i) for i in zip(*a[0])]
# Multiply by constant (1/m)
avg = np.asarray(summate)*(1./Steps)
# Multiply each value by (X-X') term
ig = [avg[i]*X_new[i] for i in range(len(avg))]
return ig
```
